IWF Showcase 2010

New Wood Adhesives Debut at Booth 2016

New Adhesives Lineup Makes It Easy to Find the Right CARB-Compliant Adhesive

Franklin Adhesives & Polymers makes it easy for you to meet CARB requirements when assembling your plywood and lamination products with the new Plywood Line, a first-of-its-kind lineup of seven CARB-compliant adhesives.

The line offers four PVA products, one EPI adhesive – and our first-ever set of bio-modified adhesives, based on soy technology developed during research funded through a grant from the United Soybean Board.

All adhesives in the plywood line provide ANSI/HPVA Type 2 water resistance at minimum – and bring you maximum choice in selecting a CARB-compliant adhesive for your operation.

**MEET A NEW EPI ADHESIVE TOUGH ENOUGH
to Bond Treated Wood**

We will be coming on strong at IWF this year – with the introduction of a new EPI adhesive, Advantage EP-940, that is robust enough to bond treated lumber and other wood

substrates typically difficult to glue. Advantage EP-940 works well on treated Ponderosa Pine, Acacia wood and some plastic composites as well as various proprietary-treated lumbers from some of the best wood brands in the industry.

Other notable characteristics of Advantage EP-940 include reduced condition time over PVA adhesives, less foam and good spreader stability.

Our newest EPI adhesive also has no added formaldehyde, qualifying for LEED credit 4.1 – and helping you lead in the green building movement. Call us at **1.800.877.4583** to have your hard-to-glye substrate tested.

For more information on the Plywood Line or Advantage EP-940, visit us at **IWF BOOTH 2016** or **www.franklinadhesivesandpolymers.com**
